FRONT MATTER

DISCLAIMER: Read this document at your own risk! Not only could it be a total waste of time, it might make you a straight-up dumber, more-biased, and just generally worse investor. I am not necessarily an expert in EITHER finance or investing in general OR any products mentioned below. I am NOT a financial advisor, and this analysis is NOT professional financial advice NOR to be interpreted as such. Unless someone has a fiduciary legal obligation to you, you should NEVER trust him or her to put your best interest before their own. As always, past investment performance CANNOT guarantee future results, ESPECIALLY when faced with limited history or short horizons. You could lose part or ALL of your initial principal. To the extent that I present data and/or calculations, I CANNOT promise that they are correct OR useful. Opinions, if and where present, are (a) my own and (b) NOT to be interpreted as professional financial advice. This is NOT a recommendation, solicitation, or offer EITHER to take a position in or trade any security, derivative, fund shares, or other asset, OR to enter into any contract, agreement, or other financial relationship. Before making any personal financial or investment decisions, consult with a qualified professional financial advisor about how to build a disciplined, well-diversified, and risk-managed portfolio that is best for you. . . . **DISCLOSURES:** None. This analysis is not sponsored, commissioned, or vetted by any financial advisor or investment manager; I have not and will not get paid to say or imply anything below; and I have no commercial interests in its publication, circulation, or effects.

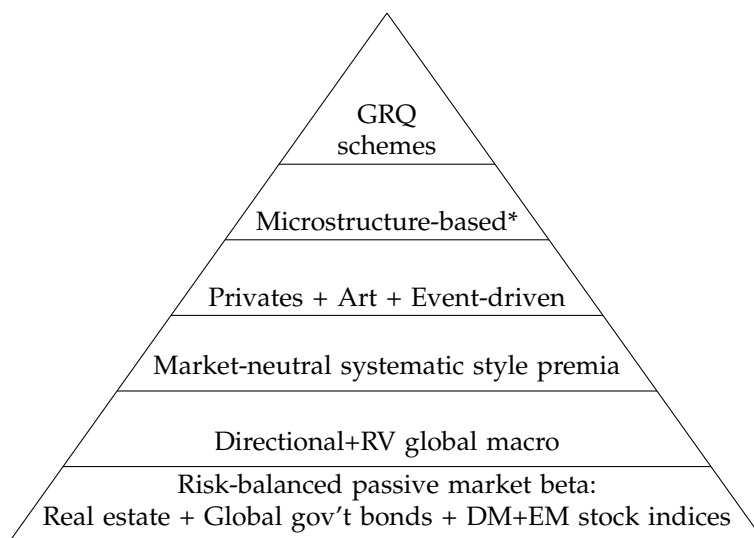

THE IMPORTANCE OF DISCIPLINE

Before you make any financial or investment decision, ask yourself whether it maintains a portfolio that is:

- Transparent
- Low-churn (hence, low-tcost and low-tax)
- Diversified
- Risk-managed (controlling volatility, skew, kurtosis, value-at-risk, and stress losses)

If the answer is “no”, DON’T DO IT!

THE PORTFOLIO FOOD PYRAMID

*Things like stat-arb and HFT

As you go rightwards and up the pyramid, asset classes become increasingly hard-to-access and low-capacity. Each layer of the pyramid should be long-term-uncorrelated with—or point-in-time-hedged against—moves in the layers below. Otherwise, all you’re doing is adding an undiversifying, expensive, illiquid version of the same stuff you could have gotten below! For example, a lot of corporate-bond funds mainly just load up on single-name default risk (which is highly-correlated with single-name equity risk, which is highly-correlated with global equity risk, which is easier and cheaper to get from liquid stock-index ETF’s or futures) and global yield-curve risk (which is easier and cheaper to get from liquid government bonds or interest-rate swaps). The flip side of this is that, if you can find a good and trustworthy manager, going upward offers more opportunities to generate true “alpha” (proprietary and reliable bets on idiosyncratic returns) rather than just scamming you with expensive blackboxes full of beta (well-known long-term-compensated global risk factors).
